

Now Offering

Specialized SWI Brain Imaging

(Susceptibility Weighted Imaging)

SWI Brain Imaging is more accurate and far more detailed than traditional MRI Imaging

Trauma case comparing conventional imaging (left) and SWI (right). The patient had an auto accident and suffered subsequent cognitive impairment. Conventional imaging on left does not show any effects, but SWI on right shows evidence of micro hemorrhages and edema. Data collected on 1.5T scanner.

- ✓ Convenient - SWI offered at multiple locations throughout the state
- ✓ More accurately identifies injuries, including micro-hemorrhages often not detected with traditional MRI imaging
- ✓ Performed at 1-2mm slices vs traditional MRI at 3-5mm slices
- ✓ Clinically indicated for identifying Mild Traumatic Brain Injury, Whiplash, Concussion & Contusions to the brain
- ✓ Can only be performed on High-Field MRI
- ✓ No additional cost to patient
- ✓ Admissible in court
